Document: Q&A Preparation — Sunday Meeting **Prepared for:** Rodolphe Belin ("Rudi") — Principal Investor **Prepared by:** Zharkyn Ryspayev ("Zhan") — Founder, CEO/CTO · Dmytro Tsvyk ("Dymo") — Co-founder, Operations Principal **Date:** 2026-04-18 **Meeting:** Sunday 2026-04-19, Al Jurf **Status:** Internal preparation — anticipated questions with direct answers

1. Why 80 % Agency equity initially?

Rudi is the sole outside capital source for the Agency launch. The 80 % position reflects the full capital risk he is absorbing during the payback period — entity formation, RERA licensing, office, first agent, marketing, and working capital are all funded by his AED 1 M. This is the controlling-investor position during payback. After Rudi receives 2× in cumulative distributions OR five years pass (whichever comes first), the Sunset rebalances the Agency to a three-way equal partnership — 33.34 % Rudi / 33.33 % Dymo / 33.33 % Zhan. The structure rewards Rudi's capital risk during the uncertain early years and transitions to equal partnership when the Agency is established and Rudi has been made whole.

2. What is the Sunset Clause and how does it work?

The Sunset fires on the **earlier** of two triggers: **(a)** cumulative cash distributions paid to Rudi from both Agency and Platform combined reach **AED 2,000,000** (2× the Investment); **OR (b) five (5) years** have elapsed since SAFE execution. Upon trigger, Rudi's Agency equity automatically reduces from 80 % to 33.34 %. Dymo moves from 10 % to 33.33 % (+23.33 pp); Zhan moves from 10 % to 33.33 % (+23.33 pp). The 0.01 pp tiebreaker goes to Rudi in recognition of his capital contribution. Platform cap table and the 70 / 10 / 10 / 10 profit split are **unchanged** post-Sunset — Rudi keeps his 10 % profit share and his 10 % Platform upside for the lifetime of both entities. The time cap guarantees control converts regardless of business velocity.

3. What if the agency doesn't earn enough and AED 2 M never returns?

The time trigger (5 years) is the answer. Rudi's 80 % Agency position converts to 33.34 % at the 5-year anniversary **regardless of business performance** — the control conversion is guaranteed in calendar time, not only in financial outcomes. If the financial trigger fires earlier (cumulative distributions reach AED 2 M before Year 5), Sunset happens earlier; if not, it happens at Year 5 exactly. The 1× non-participating liquidation preference separately guarantees that in any sale scenario Rudi recovers his AED 1 M or takes his pro-rata share, whichever is higher. The Platform entity remains a separate lifetime upside at 10 % Rudi. Base case: 8 deals Year 1 at AED 320 k blended commission → ~AED 2.56 M gross; at ~50 % net margin ~AED 1.28 M net; Rudi's 10 % share ≈ AED 128 k per year. Over 5 years that is ~AED 640 k — short of the AED 2 M financial trigger, so the 5-year time cap fires first in the base case.

4. What if Dymo or Zhan leaves?

Zhan and Dymo equity vests over 2 years with a 6-month cliff. Departure before month 6 forfeits 100 % of unvested equity back to the Company treasury. Between months 6 and 24, equity vests monthly. Full vesting at month 24. Involuntary termination without Cause triggers single-trigger acceleration. On change of control combined with termination, double-trigger acceleration applies. Rudi's equity is separately fully vested from day one.

5. Why 70 % of Agency profit to the Platform?

Three reasons. **Commercial:** the Platform is the long-horizon asset — 85 Master Tree modules, 10-year roadmap, Series A / B / C path, potential IPO Years 5–10. The Agency is the immediate cash engine but does not go public. Routing 70 % of Agency profit to Platform development compounds value toward the exit. **Financial:** Rudi still participates in Platform upside via his 10 % ADGM HoldCo stake (perpetual, unaffected by Sunset). **Tax:** the 70 % flow is structured as a Service Fee from Agency to Platform, deductible at Agency level (reducing Agency CT) and taxable at Platform level where QFZP targets 0 % on qualifying income. Combined effective tax on the 70 % flow: 0 % Agency (deduction) + 0 % Platform (QFZP qualifying) = 0 % effective. Full detail in `PROFIT_DISTRIBUTION_MECHANICS.md` §3 and §8.

6. What is the realistic exit scenario and when?

The Platform is the IPO path. **Platform Series A / B / C** — institutional rounds at the ADGM entity Years 2–5, each providing secondary-liquidity opportunities for Rudi pro-rata. **Platform IPO Years 5–10** — when the Master Tree reaches scale, the ADGM HoldCo is the listed entity. **Agency continues as a brokerage** — cash engine, not separately IPO'd; potential strategic acquisition in Years 3–5 by a regional incumbent is possible but optional. Rudi's upside is dual: (a) quarterly Agency distributions (10 % of net profit for life — AED 128 k+/year base case compounding) plus the Sunset conversion, and (b) Platform equity appreciation through Series rounds to IPO. Rudi's 1× non-participating liquidation preference protects downside on any Liquidity Event.

7. What are the tax implications? How much actually reaches me?

Three-layer tax-efficient design. **Agency layer** — UAE CT 9 % above AED 375,000, with Small Business Relief (0 %) in Year 1 if revenue ≤ AED 3 M; the 70 % Service Fee to Platform is deductible, further reducing Agency taxable income; VAT 5 % is pass-through. **Platform layer** — ADGM Qualifying Free Zone Person targets 0 % on qualifying income (inter-company Service Fee income can qualify if transfer-pricing documentation is properly prepared); 9 % on any non-qualifying. **Shareholder layer** — UAE has NO personal income tax and NO withholding tax on domestic dividends. Rudi's foreign tax residence (to be confirmed with Rudi's advisor) determines any external withholding. Target combined effective tax burden across the structure: **0–9 %**. From every AED 1,000,000 of gross Agency profit, approximately AED 910,000 – 1,000,000 flows through to Platform + shareholders after UAE tax.

8. What anti-dilution protection do I have?

Two-tier protection reflecting the two-entity structure. **Agency — none needed.** The Agency does not raise Series rounds; its cap table is stable apart from the Sunset rebalance (which is pre-agreed and automatic). There are no dilution events to protect against. **Platform — weighted-average (broad-based) up to Series A first closing.** If the Platform raises at a lower valuation than Rudi's entry before Series A, Rudi is partially compensated via the broad-based weighted-average formula. After the first closing of a Series A round (priced equity ≥ USD 2 M, institutional lead), anti-dilution terminates and Rudi has **pro-rata rights** — he may invest his own capital alongside any new Platform investor at the same price, to maintain up to 10 % Platform ownership. This is institutional-round standard. Founders (Zhan 80 %, Dymo 10 %) dilute pro-rata with Rudi on Platform Series rounds after Series A.

End of Q&A preparation. All answers cross-referenced to the Memorandum of Understanding and supporting documents in the package.
